1100D Wireless Receiver

Description
The 1100D Wireless Receiver provides up to 32 wireless zones for XT30/XT50 Series panels with Version 102 or higher. The 1100D provides two-way, supervised communication using 900 MHz frequency hopping-spread-spectrum technology. The receiver can be mounted up to 500 feet from the panel enclosure.

Compatibility
- XT30 Series panel
- XT50 Series panel using firmware version 102 or higher

What is Included
- One Model 1100D Wireless Receiver
- One 4-wire Harness
- Hardware pack

Installing the Wireless Receiver
Selecting a Location
Choose an optimum location to mount the receiver. The 1100D Wireless Receiver is typically mounted at a distance not to exceed 500 feet away from the panel enclosure. A location should be selected that will be centrally located between the 1100 Series transmitters used in the installation. Install the receiver away from large metal objects. Mounting the receiver on or near metal surfaces impairs performance. Do not use shielded wire between the panel and receiver. When selecting the proper mounting location and operation, refer to the LED Survey Operation section of the specific installation guide for the transmitter being installed.

Mounting the Receiver
1. Remove the cover from the plastic housing by squeezing both sides toward each other.
2. Secure the receiver to the wall ensuring the two antennas are pointing up and the wall tamper switch makes proper contact with the wall. Use the supplied screws in the mounting hole locations as shown in Figure 1.

Figure 1: Receiver PCB
Keypad Bus Wiring
The 1100D Wireless Receiver easily interfaces with the XT30/XT50 Series panels using the keypad bus.

Harness Connection
Refer to Figure 2, the panel programming guide and use the following steps to connect the panel and receiver:
1. Using the supplied 4-wire harness, connect from the 1100D Wireless Receiver PANEL header to the panel keypad bus terminals 7, 8, 9, and 10. Observe wire colors when connecting to the terminals.
2. In System Options, program the House Code (1-50). In Zone Information, program the wireless zones.
3. Snap the cover back on the unit. The panel immediately recognizes the 1100D Receiver if the panel is programmed with a house code.

Note: If you are using an 1100D with an XT50 Series panel, ensure BUILT IN 1100 WIRELESS is set to NO in the System Options section of panel programming.

1100D Receiver Operation
The 1100D receiver automatically sends the panel house code to wireless transmitters when the unique transmitter serial number is programmed into the panel. The house code identifies the panel, receiver, and transmitters to each other. The receiver only listens for transmissions using the specified house code and/or programmed transmitter serial number.

Note: When setting up a wireless system, it is recommended to program zones and connect the receiver before installing batteries in the transmitters.

Transmitters can be programmed for supervised or unsupervised operation. When programmed as supervised, the transmitter must communicate with the receiver within the programmed number of minutes. If the transmitter fails to communicate, the panel displays a missing condition.

Note: When a receiver is installed, powered up, or the panel is reset, the supervision time for transmitters is reset. If the receiver has been powered down for more than one hour, wireless transmitters may take up to an additional hour to send a supervision message unless tripped, tampered, or powered up. This operation extends battery life for transmitters. A missing message may display on the keypad until the transmitter sends a supervision message.

When any wireless zone programming is changed in the panel, receiver zone programming is updated when exiting panel programming. During the update, all wireless zones display as normal for approximately one minute, regardless of the actual state of the wireless device(s).

LED Operation
Six LEDs display receiver operation and activity. Refer to the table below as required.

<table>
<thead>

</table>
Zone Configuration
Refer to the panel programming guide for complete wireless programming information.

Note: When any wireless input zone for a particular address is programmed (Ex: 11-14 = Addr 1), the 1100D responds to the panel for this address. Other devices, such as keypads or hardwired zone expanders, cannot use this address. Zones connected directly to the panel cannot be wireless.

Transmitter Survey LED Operation
DMP 1100 Series transmitters provide Two-way (transmit acknowledge) operation. This advanced data protocol allows each transmitter to confirm that each of its messages (alarm, checkin, tamper, low battery) are received and acknowledged by the 1100 Series receiver. The confirmation is indicated visually by use of an LED on each transmitter. This Survey LED should be used during installation to test each transmitter for proper operation. A full definition of the Survey LED follows.

The red LED on an 1100 Series transmitter turns on when the processor wakes up to send a message. Then after a series of communication steps are completed (successful or not), the LED turns off when the processor goes back to sleep. 99.9% of the time the processor is asleep in normal operation. The following list summarizes various indications that can be observed on the LED and a definition for each. Note this is for a single message. Example, pressing and holding the tamper switch.

Single 1/16 second flash
- Processor wakes up
- Transmitter receives immediate synchronization from receiver
- Transmitter transmits
- Transmitter receives immediate acknowledgement from receiver
- Processor goes to sleep

Single Pulse greater than 1/16 second but shorter than 8 seconds
- Processor wakes up
- Transmitter receives synchronization from receiver - possibly not immediate
- Transmitter transmits
- Transmitter receives acknowledgement from receiver - possibly not immediate
- Processor goes to sleep

Steady for 8 seconds
- Processor wakes up
- Transmitter never receives synchronization from receiver, or might receive synchronization
- Transmitter transmits if synchronization was received
- Transmitter never receives any further data from receiver
- Processor times out and goes to sleep

Multiple short flashes
- Processor wakes up
- Transmitter receives synchronization from receiver
- Transmitter transmits
- Transmitter receives data from receiver, but not a valid acknowledgement
- Processor briefly goes to sleep
- Entire sequence is repeated, each short flash indicates a cycle
Troubleshooting Using the Transmitter Survey LED
If a transmitter is unable to reliably communicate a message to the receiver, or is reported as missing, the Survey LED can be used to help diagnose the issue. If the missing transmitter cannot be explained by obvious reasons such as a damaged transmitter, failed battery, or changes in building construction; then the Survey LED should be used.

To use the Survey LED operation to help diagnose a field issue, complete the following steps on an 1100 Series transmitter. Repeat the following sequence 5 times and write down the LED operation for each tamper switch action.

- Press and hold the tamper switch
- Observe the LED until it turns off for at least 5 seconds
- Release the tamper switch
- Observe the LED until it turns off for at least 5 seconds

You now have observed the LED 10 times. Based on the results you have recorded use the list below to assist in troubleshooting.

LED turns on a single time for less than 1 second 8 to 10 times.
- System is working properly

LED turns on for more than 1 second 3 to 9 times.
- The transmitter or receiver needs to be relocated

LED turns on for more than 1 second all 10 times.
- The receiver is not turned on, or is not operating
- The transmitter is not programmed into the receiver
- The transmitter or receiver needs to be relocated

LED flashes multiple times with a single tamper press or release 3 to 10 times.
- The transmitter or receiver needs to be relocated

LED never turns on.
- The transmitter battery is dead
- The tamper switch is being pressed or released too quickly
- The tamper switch or other part of the transmitter is broken

LED stays on constantly and is dim
- The transmitter battery is almost dead
- The transmitter is broken

General Wireless Troubleshooting
If ALL wireless devices do not operate, refer to the following checklist:
- Verify equipment model numbers.
- Verify the House Code (1-50) is programmed in System Options.
- Verify the 4-wire connector from the receiver PANEL header is connected to the XT30/XT50 panel terminals 7, 8, 9, and 10.
- Verify what zone numbers are assigned as wireless zones and check the address settings of other device(s) connected to the keypad bus to ensure no duplicate addresses have been used.
- Verify the 1100D LEDs are operating as listed in 1100D LED Operation on the previous page.
- Verify transmitters have batteries correctly inserted.
Transmitter Supervision Time
For Listed installations, program the transmitter supervision time in panel zone programming as listed in the following table. Refer to the XT30/XT50 Series Programming Guide (LT-0981) for complete wireless programming information.

FCC Information
This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:
(1) This device may not cause harmful interference, and
(2) this device must accept any interference received, including interference that may cause undesired operation.
Changes or modifications made by the user and not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment.

Note: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Note: The 1100 Series wireless system is a two-way supervised wireless design. It is compliant with FCC rules as they pertain to 900 MHz Spread Spectrum devices. In rare instances it has been observed that certain 900 MHz cordless telephones may occasionally experience a clicking sound on the telephone while in use. If this occurs, it may be resolved by selecting a different channel on the cordless telephone, or replacing the cordless phone with a different brand or model of 900 MHz telephone or other cordless telephone. To comply with RF exposure requirements, a minimum distance of 20cm must be maintained between the antenna and all persons.

Industry Canada Information
This device complies with Industry Canada Licence-exempt RSS standard(s). Operation is subject to the following two conditions:
1. This device may not cause interference, and
2. this device must accept any interference, including interference that may cause undesired operation of the device.

Le présent appareil est conforme aux CNR d’Industrie Canada applicables aux appareils radio exempts de licence. L’exploitation est autorisée aux deux conditions suivantes:
1. L’appareil ne doit pas produire de brouillage, et
2. L’utilisateur de l’appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d’en compromettre le fonctionnement.

This system has been evaluated for RF Exposure per RSS-102 and is in compliance with the limits specified by Health Canada Safety Code 6. The system must be installed at a minimum separation distance from the antenna to a general bystander of 7.87 inches (20 cm) to maintain compliance with the General Population limits.

L’exposition aux radiofréquences de ce système a été évaluée selon la norme RSS-102 et est jugée conforme aux limites établies par le Code de sécurité 6 de Santé Canada. Le système doit être installé à une distance minimale de 7.87 pouces (20 cm) séparant l’antenne d’une personne présente en conformité avec les limites permises d’exposition du grand public.

Specifications
Operating Voltage: 8.0 to 14VDC
Current Draw: 40mA
RF Power Rating: 27mW
Frequency Range: 905-924 MHz
Dimensions:
- Receiver Housing: 4.65” L x 3.1” W x 1.4” H
- Antennas: 8.6” H
Color: White
Housing Material: Flame retardant ABS
