

Virtual Keypad™

ACCESS

Give Your Customers the Flexibility
of Cloud-Based Access Control

FEATURES

- ▶ Complete cloud-based access control management software that integrates with your intrusion system
- ▶ Arming/Disarming
- ▶ Control lights, locks and thermostats
- ▶ View and record video
- ▶ Manage system users, schedules and profiles
- ▶ Lockdown public doors
- ▶ Keypad turns red in alarm
- ▶ Works from any Internet-connected computer using most popular browsers
- ▶ Remotely manage user codes and credentials
- ▶ Holiday management

For users who don't want a dedicated server for their access control systems, DMP has expanded its options with the cloud-based Virtual Keypad™ Access.

Virtual Keypad Access expands your access control opportunities with additional services. Add fully featured access control with an intuitive cloud-based user interface to your intrusion installs for a fraction of the cost of traditional access control. You can create customized offerings that include user management, video integration, schedules and reporting capabilities. Because Virtual Keypad Access is maintained via the cloud, consumers have the flexibility to remotely manage their own systems, or it can be managed by a dealer for them.

Unlike offerings based on traditional access control software, Virtual Keypad Access doesn't use a client-server approach. Users interact with the service via a browser interface or smartphone app, eliminating the need to use a computer onto which client software has been loaded.

In addition to no software installation necessary, both you and your customer benefit from not having to worry about maintenance cost, downtime or applying software updates.

There are lower up-front costs of ownership. And you don't have to log into a specific computer to change an employee record. It's easy to manage from anywhere.

Virtual Keypad App

Virtual Keypad Access is the natural progression of the DMP Virtual Keypad app that manages the intrusion system. The app is simple to download and use for Apple® iPhone and iPad owners, as well as Android™ users who want the ability to access a number of security system keypad functions remotely. It's compatible with new and existing DMP XR Series™ control panels with cellular or network connections.

As the DMP panels have a robust integration of intrusion and access control within the architecture of their hardware, the software or web-based control is the obvious next steps by providing the same rich user experience. From the browser screen comes an advanced access control and intrusion interface that blends the best of both worlds into a single easy-to-use system that's also easy to deploy.

It's a solution that provides the user experience customers are demanding. The Virtual Keypad Access platform is always advancing with new features and capabilities, which are automatically made available as they are implemented. This ensures that the latest and greatest product is always available.

Multi-Site Management

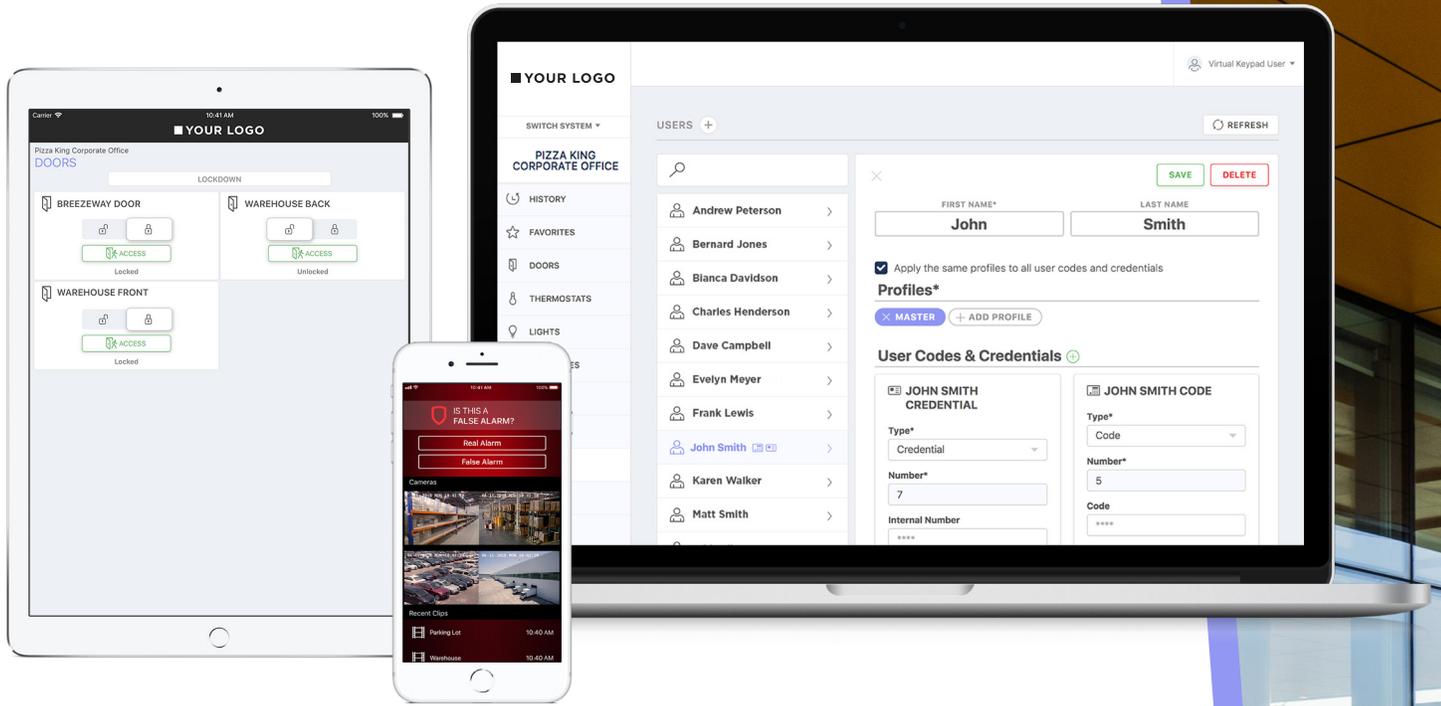

Virtual Keypad Access eliminates arduous data management. When you need to add users or schedules, you only need to create that data record once. Multi-Site Management allows you to share that record with multiple panels or locations.

Managed Credentials

This allows you to choose either User Code or Access Card. This credentialing makes data entry faster and easier to manage.

Manage Holiday Dates

Setting Holiday Dates provides the system with special days when the normal opening and closing schedules are not used. Virtual Keypad Access lets you easily manage your holiday schedules, whenever you need to and wherever you are. Adjust opening and closing times however you need to.

From managing access of people to preventing unauthorized intrusions and preserving video evidence, Virtual Keypad Access provides the perfect balance of power, convenience and affordability all in a single simple solution.

Analog Video

Analog video is also supported in the Virtual Keypad platform by using the 4-Channel Analog Converter which supports up to 16 analog video channels.

Video Integration

Virtual Keypad Access supports up to 16 IP HD video cameras. View live video, trigger recording of clips in the Cloud from motion or events. Or install a local 2 TB Network Video Recorder that records continuous video all viewable from the browser or your mobile app. With video verification embedded, DMP video integrations, helps eliminate false alarms and false alarm fines and allow system users to make decisions about when and why police are dispatched.
